

NodeJS / RESTful Express App – Exercise 4

Create a basic Express app that handles resource data.

- Choose any resource (books, users, products etc.), create a model type for this resource.
- Create a RESTful Api to handle the resource data.
- Use an array as a database.
- Support an additional query parameter in the GET all endpoint:
 - o **Parameter name:** sortBy
 - o **Parameter value:** a name of a field of the resource (for example: "name").

If supplied, the endpoint will return the results sorted by the provided field. Otherwise, choose any field to be the default sort by.

Note: Use a relevant package for an efficient sortBy function.

Notes:

- Run the app, test all routes from Postman, and submit the Postman collection file with the project.
- Make sure to write clean code that follows all conventions – don't write functions, only classes and methods inside.
