

NodeJS / MongoDB Connection – Exercise 8

Create an Express app that manages posts and comments.

Data Models

- Post:
 - **postId** – string
 - **author** – string
 - **text** – string
 - **likes** – number
 - **createdAt** – Date
 - **comments** – Array<Comment>
- Comment:
 - **commentId** – string
 - **author** – string
 - **text** – string
 - **createdAt** – Date

Endpoints

- Create a post – gets the author and the text in the body, generates the **postId**, and returns the newly created post.
- Get all posts (paginated) – supports pagination query parameters:
 - **page** – number (optional, default 1)
 - **pageSize** – number (optional, default 5)

Returns:

- **page** – number
- **pageSize** – number
- **totalCount** – number
- **data** – Array<Post>
- Add a comment to a post gets the author and the text in the body, generates the **commentId**, and returns the newly created comment.
- Get recent posts – gets **hours** as a query parameter. Returns the posts that were created in the last number of hours provided.
- Get popular posts – returns the top 10 popular posts. The formula to calculate the popularity of a post is: **popularity = likes * 2 + numberOfComments**.
- Like a post.

Notes

- Organize the code, including all the layers – api, service, and DAL.

- Use matching API routes and HTTP methods. Return appropriate status codes and errors. Input validation is **optional**.
- Run the app, test the endpoint from Postman, and submit the Postman collection file with the project.
- Make sure to write clean code that follows all conventions.
